

Zamzam jirow

Part A - Project Setup Using the CLI

- * mkdir creates folders.
- * cd moves into a folder.
- * touch creates empty files.
- * echo ... > README.md puts text into a file using output redirection.
- * ls displays files.
- * cat displays file contents.
- * find . -print displays the project contents recursively.

src contains the actual program code, tests contains code used to test the program, and docs contains documentation. Keeping them separate makes a project easier to understand, maintain, and expand.

```
/tests
/docs
/docs/README.md
/src
/src/config.py
/src/utils.py
/src/main.py
iohamed@Mohameds-MacBook-Air python_lab %
```

Part B: Git Initialization and First Commit

```

mohamed@Mohameds-MacBook-Air python_lab % git init
Reinitialized existing Git repository in /Users/mohamed/python_lab/.git/
mohamed@Mohameds-MacBook-Air python_lab % printf "__pycache__/\n*.pyc\n.env\n" > .gitignore
mohamed@Mohameds-MacBook-Air python_lab % cat .gitignore
__pycache__/
*.pyc
.env
mohamed@Mohameds-MacBook-Air python_lab % git add .
mohamed@Mohameds-MacBook-Air python_lab % git status
On branch master

```

.gitignore is a file that tells Git which files and directories should not be tracked or included in commits. In this project, it prevents Python cache folders, compiled Python files, and .env files from being added to the repository. This helps keep the repository clean and prevents unnecessary or sensitive files from being uploaded.

The __pycache__/ and *.pyc patterns are important because Python automatically creates cache folders and compiled Python files when programs are run. These files are generated automatically and are not normally needed in the source-code repository. Ignoring them keeps the Git repository organized and prevents unnecessary files from being tracked.

The .env pattern is also important because .env files may contain sensitive information such as passwords, API keys, or other private configuration details.

Git commit history shows how a project has developed over time. Each commit records a set of changes along with information such as the commit identifier, author, date, and commit message. This allows developers to see what changes were made, when they were made, and how the project has progressed from one stage to another.

Part C - Writing and Committing Python Code

utils.py

```
from utils import square, is_even, celsius_to_fahrenheit

number = float(input("Enter a number: "))

print("Square:", square(number))

if is_even(number):
    print("The number is even.")
else:
    print("The number is odd.")

print("Fahrenheit equivalent:", celsius_to_fahrenheit(number))
```

main.py

```
from utils import square, is_even, celsius_to_fahrenheit
```

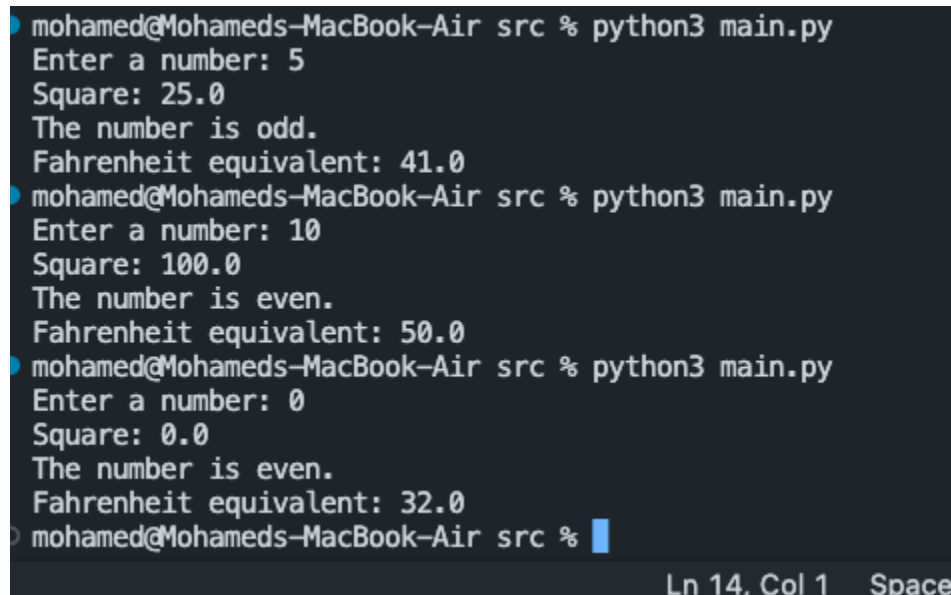

```
number = float(input("Enter a number: "))

print("Square:", square(number))

if is_even(number):
    print("The number is even.")
else:
    print("The number is odd.")

print("Fahrenheit equivalent:", celsius_to_fahrenheit(number))
```

Python's import system allows one Python file to use functions and other code defined in another Python file. In this project, the three functions `square`, `is_even`, and `celsius_to_fahrenheit` are defined in `utils.py`. The statement `from utils import square, is_even, celsius_to_fahrenheit` in `main.py` imports these functions so that they can be called from the main program. This keeps the project organized by separating reusable functions from the main program logic.

```
mohamed@Mohameds-MacBook-Air src % python3 main.py
Enter a number: 5
Square: 25.0
The number is odd.
Fahrenheit equivalent: 41.0
mohamed@Mohameds-MacBook-Air src % python3 main.py
Enter a number: 10
Square: 100.0
The number is even.
Fahrenheit equivalent: 50.0
mohamed@Mohameds-MacBook-Air src % python3 main.py
Enter a number: 0
Square: 0.0
The number is even.
Fahrenheit equivalent: 32.0
mohamed@Mohameds-MacBook-Air src %
```
